INTRODUCTION

Natural History Museums are recognized as the centers for systematics. Here the preserved and well-studied collection serves a central role as the single most important resource of systematics. Besides this, museum collections are important reference system of diversity of living organisms, to be used as the material for new evolutionary ideas. Recently, museum collections are becoming increasingly useful for molecular studies, for example for studying mitochondrial DNA (Diamond, 1990). Natural History collections are also necessary for the solution of the problem in both basic and applied sciences, besides being an important and integral part of cultural heritage. It therefore, especially in tropical countries, requires a constant and continuous attention for their preservation, study, and research. The Malacological collection of the Zoological Survey of India is unique, as it is the largest collection in Southeast Asia. The departmental collections of mollusca are the most comprehensive, developed over more than two centuries. These form a comprehensive database of the known Indian fauna and their scientific value goes far beyond the primary use of taxonomic research. The collections are used as a research resource both nationally and internationally. The collections serves as depository of primary type specimens for several Southeast Asian countries and as the main resource material from all faunal regions that is convenient for eastern researchers to visit routinely.

The museum collection of terrestrial, freshwater and marine forms include named representatives of over five thousand eleven hundred described species both Indian and exotic with an estimated three million specimens, including the types of almost 1,510 species. On an average, 5,000 specimens are normally added to the collections each year. The team of scientists of the Mollusca section apply the highest standard in the curation, conservation and enhancement of the museum's collections and develop electronic resources to support these activities and to widen and increase to the access to the information the collections contain. The team promotes the use of collections to further knowledge of the natural work through loans, visits and collaborative projects, in addition to supporting the Museum's own research programmes. The team is also active in developing and improving the methods, material and equipment across the whole field of collection, management from specification of cabinets to computer indexing.

The paper describes the type specimens belonging to the categories of holotype; paratype, cotype and neotype included in the catalogue that were described in between 1862 to 1964 *i.e.*, for 102 years. A total of 323 species are included under different type categories of the class Bivalvia, Scaphopoda and Cephalopoda under 103 genera and 50 families. The class Bivalvia includes 298 species under 93 genera and 43 families; Scaphopoda having 8 species under single genus and a single family, while the Cephalopoda have 17 species under 9 genera and 6 families. Of the 298 species of bivalves, 159 are holotypes, followed by types (70), paratypes (51), co-type (32), syntypes (21), topotypes (2), neotype (1) and 4 of undesignated status.

Scaphopoda which includes 3 described species from India and 5 from Srilanka has holotypes (2), "types" (4), paratype (1) and one of undetermined category. Among the authors, Smith described seven and Winckworth one. Class Cephalopoda includes 13 holotypes, "types" (3) and paratype (1) described by Goodrich (12), Massay (2), Adam (2) and Winckworth (1). Among these 5 species were described from Lakshadweep sea, 4 from Andaman sea, 3 from Bay of Bengal, 2 from Madras coast and one each from "Indian Coast", Sri Lanka and Singapore.

Out of the 323 total type species from the three classes of Bivalvia, Scaphopoda and Cephalopoda, 67 earlier described species have been subsequently synonymised i.e., among the 298 species of bivalves, 63 species are synonymy and the rest 235 are the valid species. From among the 13 holotypes of Cephalopoda, 4 species are synonymy and 9 species are valid species.

All these types were described by more than 40 different authors. Maximum numbers of species, 103 were described by Preston, followed by Smith (56), Prashad (49), and Nair (11). Out of the 298 described species of bivalves, 218 are described from the Indian subcontinent and 80 from other countries. Among the localities described from the described species Andaman and Nicobar group of Islands have the maximum number (46), followed by Chilka, Orissa (37), Kerala (13), Lakshadweep and Assam (10 each), and Sunderbans (8).

Zoological Survey of India's type built-up is based on the two primary sources viz., inherited from the Indian Museum and obtained from its own surveys conducted by the scientists and naturalists of the department. Bulk of the material was derived from the old holdings of the Asiatic Society of Bengal comprising marine collections made by successive Surgeon Naturalists on board the RIMS Investigator during 1884 – 1926. A perusal of the catalogue indicate the following split up of sources viz., Investigator (65), followed by N. Annandale collections (24), Chilka Survey collections (23), purchased (20), collections made by Prof. Max Weber (15), N.B. Nair (13), J. Anderson (6), A. S. Rajgopal Iyengar (4), J. Woodmason (3), H.A. Awaji (1), donations from Zoological Museum, Holland (5), Indian Museum (4), Berlin Museum staff (3), Museum staff (2), Bengal Fisheries (2) and one without any record.

Among the list of donors and workers, mention may be made of Willams and Henry Blanford, Col. H.H. Godwin – Austen and Ferdinand Stoliczka. The private collections of H H Godwin – Austen gathered in the course of his geological work in Iran, Ethiopia, Orissa and other parts of India were gifted to Indian Museum, subsequently inherited by Zoological Survey of India. Donations made by Geoffrey Nevill and S.W. Kemp also deserve a mention.

The present paper on the catalogue of mollusca is arranged in alphabetical order by genus and species within the class. It also includes data pertaining to the collector/ donor, present name of the species and the condition of the type as well as the registration number and date.

 PRESENT NAME : *Sepia prashadi* Winckworth
 COLL/DONOR : R. Winckworth TYPE STATUS : Holotype
 CONDITION : Good/Wet ORDER : SEPIODEA FAMILY : SEPIIDAE
 LOCALITY : Madras Coast, South India. YEAR OF PUBLI : 1936
 REFERENCE : *Proc. malac. Soc. Lond.*, 22 : 17, pl. 4.
 REMARKS : 1 ex.

ACKNOWLEDGEMENTS

The authors are grateful to Dr. J R B Alfred, Director, Zoological Survey of India for encouragement and for necessary facilities to work. Also thankfully acknowledge the work rendered by the team of scientists and co-workers in maintaining the collections of the department, since its inception.
