# PROTOZOA: EXCAVATA: EUGLENOZOA, Cavalier-Smith, 1981

Patatri Sarkar<sup>1,3</sup> & Jasmine Purushothaman<sup>1,2\*</sup>

<sup>1</sup>HQ, Zoological Survey of India, New Alipore, Kolkata, West Bengal 700053, <sup>2</sup>jasbose@gmail.com; <https://orcid.org/0000-0002-3980-4474>, <sup>3</sup>patatri.89@gmail.com, \*Corresponding author: jasbose@gmail.com

**Introduction:** Euglenozoa are a vital subclass of flagellate Discoba. They contain a number of well-known species that live freely alongside a few substantial parasites, several of which can infect humans. Euglenozoa can be classified into four major groups: kinetoplastea, diplomema, euglenida, and symbiontida. Euglenozoa are unicellular organisms that normally have sizes between 15 and 40 m (0.00059 to 0.00157 in), while some euglenids can reach lengths of up to 500 m (0.020 in). The majority Euglenozoa have two flagella, which are parallel to each other and inserted within an apical or subapical compartment. Some of these have a cytostome or mouth that can devour bacteria or other microscopic animals. The cell's rear and frontal surfaces are supported by the other two of all three sets of microtubules which protrude from the flagellar bases. Euglenids are the sole eukaryotes outside of Diaphoretickes to have chloroplasts without undergoing kleptoplasty, allowing them to use photosynthesis to obtain energy. Other euglenozoa obtain their food through absorption. These three membrane-enclosed chloroplasts, which also contain the pigments chlorophylls A and B, are most likely ancestors of the green alga that was long ago snatched up by a primitive euglenozoan in an endosymbiosis. The only process that reproduces is dividing cells. Throughout mitosis, the spindle microtubules grow inside the intact nuclear membrane.

**Global diversity:** Phylum Euglenozoa comprises of 122 genera and 18 families, totalling 2100 species as this phylum has its existence since the Cenomanian period.

**Diversity in India:** In India, total 88 species belonging to 7 genera and 3 families have been recorded.

## Diversity in States (Table)

Sl.No.	State/Union Territory	No. Species	No. Endemic Species
1	Andhra Pradesh	6	
2	Arunachal Pradesh	1	
3	Assam	2	
4	Bihar	5	
5	Chhattisgarh	4	
6	Gujarat	2	
7	Goa	1	
8	Haryana	1	
9	Himachal Pradesh	1	
10	Jharkhand	2	
11	Karnataka	3	
12	Kerala	2	

Sl.No.	State/Union Territory	No. Species	No. Endemic Species
13	Madhya Pradesh	3	NA
14	Maharashtra	5	
15	Manipur	1	
16	Meghalaya	1	
17	Mizoram	1	
18	Nagaland	1	
19	Odisha	3	
20	Punjab	2	
21	Rajasthan	2	
22	Sikkim	1	
23	Tamil Nadu	2	
24	Telangana	4	
25	Tripura	2	
26	Uttar Pradesh	7	
27	Uttarakhand	1	
28	West Bengal	9	
29	Andaman & Nicobar	1	
30	Chandigarh	2	
31	Dadra Nagar Haveli, Daman & Diu	1	
32	Delhi	5	
33	Jammu & Kashmir	1	
34	Ladakh	1	
35	Lakshadweep	1	
36	Puducherry	1	
<b>INDIA TOTAL</b>		<b>88</b>	<b>0</b>

**Endemism:** No species of the phylum Euglenozoa are endemic to India.

**Habitat:** Flagellated protists belonging to phylum Euglenozoa include free-living, symbiotic, and parasitic species. While many of the group's members are widely found bacteriotrophs in freshwater and marine habitats, many others, like *Euglena* sp., are photosynthetic autotrophs.

**Ecological Significance:** *Euglena* sp. can be important component of some aquatic environments as a primary producer that is consumed by other species as well as decomposers that consumes other creatures. Phylum Euglenozoa can play important ecological functions in aquatic creatures' food chain. In addition to serving as host regulators, parasites are crucial to the food chain.

**Human Significance:** The parasites of the phylum Euglenozoa have been associated with parasitic diseases in terrestrial and aquatic animals, particularly fishes, which can be detrimental from an economic standpoint.

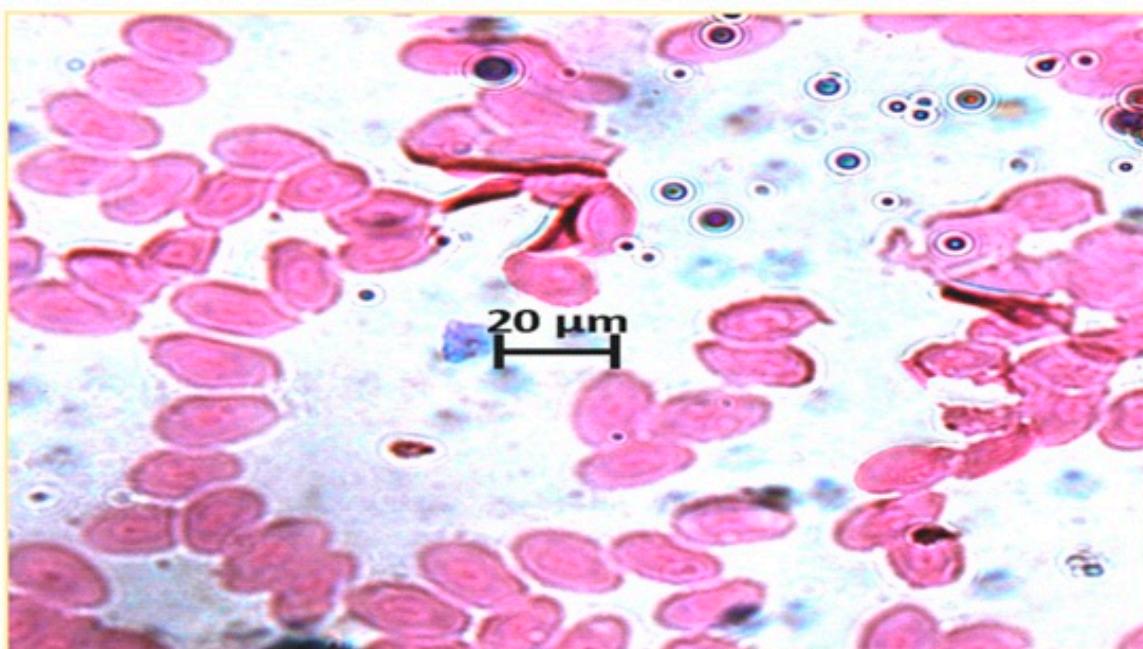

**Threatened species:** Species of the phylum Euglenozoa from India are not assessed for IUCN threat categories.

**Protected Species as per WPA (2022):** Species of the phylum Euglenozoa are not listed under any schedules of Wildlife Protection Act (2022).

**Species under CITES:** Species of the phylum Euglenozoa are not listed under any appendices of CITES.

**Invasive alien species:** No Euglenozoa species are reported to be invasive in India.

**Gap areas:** There aren't many phylum Euglenozoa studies done in India. It is essential to perform a thorough study of phylum Euglenozoa in order to fully understand the diversity of the phylum in India.

*Trypanosoma rotatorium* Mayer, 1843 from host *Bufo* sp. Garsault, 1764
