FORAMINIFERA

¹Zoological Survey of India, Marine Biology Regional Centre, 130 Santhome High Road, Chennai – 600 028, Tamil Nadu; ²Zoological Survey of India, Prani Vigyan Bhavan, M-Block, New Alipore – 700053, Kolkata, West Bengal; *Corresponding author: padmazsi@rediffmail.com

Introduction: Foraminifera are small hole bearing organisms found in tropical water to polar region. The faunal group is known as “forams”. Foraminiferans are single celled animals produced chambered shells made up of calcium carbonate. The faunal group evolved 900 to 650 million years ago. The Phylum Foraminifera is classified under Kingdom Chormista and Subkingdom Harosa.

Global diversity: World-wide, 8891 species of foraminiferans are recorded as accepted till date distributed under four classes.

Diversity in India: A total of 595 species of foraminiferans are reported from the Indian waters belonging to four classes, 11 orders and 99 genera.

Diversity in States: Presented in table 1.

Table 1: Foraminifera of India, State-wise distribution

| Sl. No. | State/ Union Territory | No. of Species |
|---------|------------------------|----------------|
| 1. | Andhra Pradesh | 41 |
| 2. | Gujarat | 80 |
| 3. | Goa | 45 |
| 4. | Karnataka | 32 |
| 5. | Kerala | 56 |
| 6. | Maharastra | 34 |
| 7. | Nagaland | 41 |
| 8. | Tamil Nadu | 185 |
| 9. | West Bengal | 58 |
| 10. | Andaman and Nicobar | 164 |
| 11. | Lakshadweep | 246 |

Endemism: No endemism has been recorded from India.

Habitat: Foraminiferans are either planktonic or benthic in nature and found from marshes to deep oceans, from tropics to poles. A few are known from fresh and brackish water also.

Ecological Significance: Foraminifera play an important role in understanding of geological record. Planktonic foraminiferans are used as tracer of surface-water properties. Foraminifera are also studied to understand heavy metal pollution, distribution of the faunal community is discovered present and past tsunami imprints. They also play a key link between autotrophs and benthic organic carbons.

Human Significance: Foraminiferans are used in exploration of petroleum along with to know age paleoenvironment sediment strata.

Threatened species: No species of foraminifera from India is assessed for IUCN threatened categories.

Protected Species as per WPA: Foraminiferans are not listed under any schedules of Indian Wildlife (Protection) Act, 1972.

Species under CITES: There is no species enlisted under the CITES Appendices.

Invasive alien species: No foraminiferan species is reported from India as an invasive.

Gap areas: The foraminifera of the Odisha have not explored and no record of the faunal group is found. Apart from the maritime time states of India, only sediment of Nagaland has been studied and other states are not studied. Comprehensive studies are required to explore this faunal group along with fossilized forms.

Systematic list: Species list cited below (Table 2).
