Introduction: Nematodes parasitic in arthropods occur naturally in soil environments and find their host due to carbon dioxide, vibration and other chemical cues (Kaya and Gaugler, 1993). The arthropod hosts include Diptera, Hymenoptera, Thysanoptera, Coleoptera, Dictyoptera, Orthoptera, Diplopoda and Chilopoda. The relationships between nematodes and its arthropod hosts vary from temporary to obligatory parasitism. Arthropod nematode associations can be grouped into three basic types: Phoretic relationship, facultative parasitism and obligate parasitism (Poinar, 1975). The work on arthropod parasitic nematodes in India was initiated by Iyenger (1927), he reported mermithids as an obligate parasite from mosquitoes. Some of the important contributions include Ayyar (1940), Basir (1940 - 1956), Rao (1965-1980), Reddy and Rao (1984-1987), Parveen and Jairajpuri (1981-1985), Rizvi and Jairajpuri (1995-2000), Shah and coworkers (2003-2004), Gantait and Coworkers (2005- 2013) and few others.

Global diversity:

Diversity in India: In India, 95 species belonging to 35 genera, 14 families, 5 orders and 2 classes are recorded.

Endemism: No endemism reported in Nematodes

Habitat: Mainly parasitic in arthropod hosts like Diptera, Hymenoptera, Thysanoptera, Coleoptera, Dictyoptera, Orthoptera, Diplopoda and Chilopoda.

Ecological Significance: They are mainly utilized as biological control agents for controlling harmful insects.

Human Significance: Nil

Threatened species as per IUCN: Species of Nematodes are not assessed for IUCN threat categories.

Protected Species as per WPA (2022): Nematodes are not listed under any schedules of Wildlife Protection Act (2022).

Species under CITES: are not listed under any appendices of CITES.

Invasive alien species: Not assessed

Gap areas: Except for a few states, Andhra Pradesh, Telangana and Uttar Pradesh, the number of arthropod parasitic nematodes reported is very less. Most of the states and UTs of India remains unexplored for this group.
