ARTHROPODA: CRUSTACEA: DECAPODA: BRACHYURA (MARINE CRABS)

K. Valarmathi

Zoological Survey of India, Kolkata, Valarkamacro@gmail.com

Introduction: Brachyura is an infra order of the order Decapoda, an economically important and highly diverse order of the subphylum Crustacea. It comprises the true crabs, which inhabits various ecosystems like marine, freshwater, brackishwater, mangrove and even terrestrial environment. Due to their diverse habitat preferences, ornamental look, active behaviors, economic importance, yummy taste etc., they attract even common man towards them. It is the more commonly available and extensively studied crustacean group.

The inventory of Indian Brachyuran crabs were initiated by Linnaeus (1758) through the crabs collected by the trade ships, it was followed by many renowned workers like Fabricius (1775, 1787, 1793), Herbst (1782–1804), H. Milne Edwards (1853) and Henderson (1893). Various expeditions undertaken by the Royal Indian Marine survey ship Investigator in the years 1891 to 1905, primarily in the Bay of Bengal, Andaman and Nicobar islands, Lakshadweep Islands and west coast of India and the contributions made by the reputed cardiologists like Alcock (1893, 1894, 1899a, c), Alcock and Anderson (1894a, b, 1899), Wood-Mason (1874, 1891, 1892), and Wood-Mason and Alcock (1891a-h) have resulted in the discovery of many new crab species. Apart from these major contributions several other researchers have enriched the knowledge of marine crabs through their significant contributions (Trivedi *et al.*, 2018b; Valarmathi, 2020). In addition to that several checklists are also published time to time (Dev Roy, 2008, 2013, 2017), recently Trivedi *et al.* (2018b) has published detailed review of Marine Brachyuran crabs with a list of species available in India and Valarmathi (2019, 2020, 2021) has listed the brachyuran crabs available in the Indian Mangroves, Coasts and Deep Sea.

When compared to other groups of Crustaceans the Brachyuran crabs are well explored and even now several researchers are showing keen interest in the study of marine Brachyuran crabs which results in the addition of many new species and new records crabs every year (Padate *et al.*, 2019; Trivedi & Tan, 2019; Suvarna Devi *et al.*, 2019; Bhat & Trivedi, 2021; Padate *et al.*, 2020c; Padate *et al.*, 2020a; Pati *et al.*, 2020b; Prakash and Marimuthu, 2020; Trivedi *et al.*, 2020; Padate *et al.*, 2021; Patel *et al.*, 2021; Mitra, and Ng, 2021; Trivedi *et al.*, 2021b; Trivedi *et al.*, 2021a; Mayura Khot and Jaiswar, 2021; Pati *et al.*, 2022; Ng *et al.*, 2022; Prema *et al.*, 2022; Prema *et al.*, 2022 and Cubelio *et al.*, 2023)

The present work provides an updated checklist of Brachyuran crabs reported so far from Indian marine, estuarine and mangrove zones and the exclusive freshwater crabs are not included in this list. In this paper the author has not elaborated the details of the contribution made by numerous workers because several checklists published by the earlier workers and the recent annotated checklist on the marine brachyuran crabs of India by Trivedi *et al.*, (2018b) provide major details regarding this group.

Global diversity: Globally 7400 species of brachyuran crabs belonging to 1439 genera, 103 families and 39 superfamilies (Trivedi *et al.*, 2018) are known.

Diversity in India: Trivedi *et al.* (2018b) reported 910 species of marine brachyuran crabs placed under 361 genera and 62 families from India. Recently, Valarmathi (2020) reported 736 species brachyuran crabs belonging to 308 genera, 55 families and 29 superfamilies from Indian Coasts. The present inventory reveals the occurrence of 944 species of marine crabs belonging to 393 Genera, 65 families and 30 super families. As for as the states and Union Territories are concerned a highest species diversity is observed in Andaman & Nicobar Islands where 596 species are known so far which is followed by Tamilnadu and other states (Table.1).

Diversity in States (Coastal) (Table 1)

Endemism: The highest number of locally endemic species were reported from Andaman & Nicobar Islands (Trivedi *et al.*, 2018b).

Habitat: Brachyuran Crabs inhabit Marine, Estuarine, Mangrove and Freshwater ecosystems. In this chapter the Freshwater Brachyuran Crabs are not included.

Ecological Significance: They are an important component of food chain and are important predator in the shallow marine habitats. They play an important role in the aquatic ecosystem by recycling dead organic matter. In mangrove zones the Grabsid crabs helps in the maintenance of shore sediments, sesarimid crabs controls the mangrove plant population and Ocypodid crabs have an impact on the distribution and abundance of meiofauna.

Human Significance: Many species of crabs are consumed by human beings. Like prawns they also play an important role in Crustacean fisheries. Like ornamental fishes the colourful crabs are also used in the marine aquarium. In addition many tribal communities believe that consumption of certain crabs species relieves them from various ailments.

Threatened species: None of the Indian Marine Brachyuran Crabs are listed in the IUCN threat categories. Only freshwater crabs are assessed for IUCN status.

Protected Species as per WPA (2022): Indian Marine Brachyuran crabs are not listed under any schedules of Wildlife Protection Act (2022).

Species under CITES: Indian Marine Brachyuran crabs are not listed under any appendices of CITES.

Invasive alien species: Three species of marine crabs namely *Charybdis (Charybdis) feriata* (Linnaeus, 1758), *Charybdis (Charybdis) hellerii* (A. Milne Edwards, 1861) and *Scylla serrata* (Forsk., 1775) are considered as alien species (Devroy and Nandi, 2017).

Gap areas: When compared to other crustaceans the marine brachyuran crabs are well explored and till date several researchers are involved in the study of these organisms. At present nearly 1/4th of the known crustaceans of India are Brachyuran crabs.
