## Introduction

Isopods are cosmopolitan group they are predominantly marine but estuarine and freshwater forms are also well-represented. A large number of this group is also terrestrial. They may be free-living, parasitic, predators, filter predators, scavengers, wood-boring, myrmecophilous or cavernicolous. Corresponding to their diverse mode of life, their shape and size also varies markedly. The size of the isopods ranges from 300 micrometers (Microcerberidae) to about 50 cm as in the genus *Bathynomus* (Cirolanidae). The Order Isopoda is divided in to 12 sub orders namely Asellota, Calabozoidea, Cymothoidea, Epicaridea, Linnoriidea, Microcerberidea, Oniscidea, Phoratoidea, Phreatoicoidea, Sphaeromatidea, Tainisopidea and Valvifera. Out of the 12 suborders except Calabozoidea, Epicaridea, Phoratoidea and Tainisopidea the remaining 8 suborders are available in India. Among this the suborder Oniscidea is terrestrial. Studies on Indian Isopods were initiated by Brunnich in 1783 and it was well explored by various eminent taxonomists and young researchers (for details refer Venkataraman *et al.*, 2016), presently the researchers pay more attention on parasitic Isopods and the recent addition is *Elthusa aquabio* Aneesh, Helna, Raj & Kumar, 2023 from Odisha.

**Global diversity:** More than 10304 species of Isopods are known globally (Hartebrodt, 2022).

**Diversity in India:** Devroy (2012) listed around 300 species of Isopods from India, Venkataraman *et al.* (2016) in their State of Art on Crustacean Taxonomy in India have mentioned that a total of 325 species of Isopods are available in India. Ravichandran *et al.* (2019) has reviewed the Isopods of the family Cymothoidea and removed 5 species from Indian list and few species were synonymised with other already known species. The present study reveals the occurrence of 338 species of Isopods currently known from India. .

	<b>INDIA TOTAL</b>		

**Endemism:** Maximum species diversity and endemism is observed in Kerala followed by Tamilnadu and Andaman and Nicobar Islands.

**Habitat:** Isopods inhabit freshwater, marine, estuarine, mangrove, deep sea, terrestrial and subterranean ecosystems and Isopods of the suborder Cymothoidea are mostly parasitic.

**Ecological Significance:** The free living Isopods play a significant role in the marine, freshwater and terrestrial environment in waste decomposition and food for other organisms.

**Human Significance:** The Limnariid and Sphaeromatid Isopods are involved in woodboring activities causes damages to the mangrove plants and wooden structures in the jetty. The cymothoid are parasitic on fin and shell fishes. The terrestrial Isopods may be used in biomonitoring and toxicity studies.

**Threatened species:** No threatened species in Indian waters.

**Protected Species as per WPA (2022):** No Isopod taxa are listed under any schedules of Wildlife Protection Act (2022).

**Species under CITES:** Indian Isopods are not listed under any appendices of CITES.

**Invasive alien species:** Six species of Isopods namely *Cirolana hardfordi* (Lockington, 1877), *Cilicaca latreillei* Leach, 1818, *Paradella diana* (Menzies, 1962), *Sphaeroma serratum* (Fabricius, 1787), *Sphaeroma walkeri* Stebbing, 1905 and *Synidotea laevidorsalis* (Benedict, 1897) are considered as invasive alien species.

**Gap areas:** When compared to the global diversity Indian diversity is very less. As for as the Isopods are concerned many Indian states are either underexplored or unexplored and in recent years the studies on parasitic Isopods of the family cymothoidae are appreciable whereas the remaining groups need more attention.
