Introduction: Thysanoptera (commonly known as thrips) are fringe winged, slenderer bodied insects with asymmetrical mouth parts (Mound and Marullo, 1996). They are usually small in size (~0.5-15 mm), and inhabit in tropical, subtropical and temperate regions (Lewis 1973, 1997). Globally, 6,414 species were reported within two suborders, nine families and five subfamilies (ThripsWiki 2023). The suborder Tubulifera, with 3,809 extant species, is considered the largest, followed by the suborder Terebrantia, with 2,593 species (ThripsWiki, 2023). Associates of this order exhibit a wide array of feeding habitats ranging from fungivorous to phytophagous. Due to their pollinating nature, thrips are considered one of the important regulators of ecosystems (Corlett, 2004). Besides, associates of this order are also known for their pestiferous nature causing damage to high-value crops through feeding and by transmitting plant pathogenic tospoviruses.

Global diversity: The order Thysanoptera comprises of 6,414 species in 787 genera within two suborders, nine families and six subfamilies.

Diversity in India: India shares ~12.5% of the global thrips diversity. In total, 816 species in 265 genera within two suborders, six families and six subfamilies.

Endemism: A total of 302 species are endemic to India. High endemism is reported in Tamil Nadu, Kerala, Manipur, Karnataka, West Bengal and Delhi.

Habitat: Thrips are polyphagous in nature and inhabits in flowering plants, dead woods and dry leaves.

Ecological Significance: Thrips are considered one of the important regulators of ecosystems. They can pollinate numerous plant species either alone or in conjunction with other vectors such as animals and wind (Corlett, 2004; Gottsberger, 2012).

Human Significance: Thrips damages several agricultural and horticultural crops causing severe economic losses. Approximately 1% of the members of this order have been reported as serious pests (Mound and Palmer, 1981) and 15 species have been reported as a carrier for vectors of *Tospovirus*.

Threatened species: Species of this order are not enlisted in the IUCN threat categories

Protected Species as per WPA (2022): Thysanoptera is not listed under any schedules of the Wildlife Protection Act (2022).

Species under CITES: Thysanoptera is not listed under any appendices of CITES.

Invasive alien species: During 2012-2022, 18 species have been recorded as invasive to the Indian ecosystem.

Gap areas: There are many geographical gaps in the biodiversity assessment of thrips from the Indian region. Several Indian states and union territories such as Bihar, Chhattisgarh, Goa, Haryana, Jharkhand, Mizoram, Nagaland, Odisha, Rajasthan, Sikkim, Telangana, Uttarakhand, Andaman & Nicobar, Chandigarh, Dadra Nagar Haveli, Daman & Diu, Ladakh, Lakshadweep and Puducherry have been poorly explored.
