**Introduction:** The vertebrate class Amphibia evolved about 365 million years ago in the Devonian Period from the lobe-finned fish and become the first terrestrial vertebrates (Carrol, 2009). However, it was during the Carboniferous Period, with the simultaneous evolution of air breathing terrestrial insects (Nel, 2019), which served as a source of prey for amphibians that they truly began to dominate the land (Lane, 1945; Stanley, 2009). Despite that, a part of their life cycle continues to remain in the water due to which they became adapted to both aquatic and terrestrial habitats that led to this group of fauna being named as Amphibia (meaning *amphi* = both, and *bios* = life, in Greek). Amphibians are a group of cold-blooded animals that comprises of frogs, toads, caecilians, newts and salamanders. Phylogenetically, they are divided into three living taxonomic orders, namely, order Anura (frogs and toads), order Gymnophiona (caecilians) and order Caudata (newts and salamanders). While caecilians are largely fossorial, aquatic or semi-aquatic, salamanders usually dwell in small water bodies, forest leaf-litters, meadows or moist ground under the rocks (Gower and Wilkinson, 2005; Hegde and Deuti, 2007). However, it is the anurans that are truly cosmopolitan in their distributions and habitats as they inhabit aquatic, semi-aquatic, marshes, terrestrials, forest leaf-litters, burrows, bushes and trees, with some being truly arboreal in nature. Amphibians are considered as 'ecological indicators' as they are the first to get affected for any environmental changes that happen on land, in water and in air (Zhou *et al.*, 2008; Simon *et al.*, 2011)

**Global diversity:** Globally, there are 8,617 species of amphibians divisible into three orders and 75 families (Frost, 2023). Of these, more than 88% of these species belong to the order Anura (frogs) with 7,586 species; while order Caudata (Salamanders) has 810 species and the order Gymnophiona (Caecilians) has 221 species.

**Diversity in India:** In India, a total of 454 species of amphibians are recorded to occur of which 411 species belong to order Anura, 2 species belong to order Caudata and 41 species belong to order Gymnophiona (Dinesh *et al.*, 2023).

Among anurans, the tadpole stages are largely aquatic with the adult stage occupying a variety of habitats from aquatic to terrestrial, sub-terrestrial to arboreal. However, bush frogs are exceptional due to the direct development where imago's resembling adults emerge directly from the egg bypassing the tadpole stage. In salamanders, eggs are hatched into free swimming tadpole larvae with external gills, which later develop into adults. In gymnophiona, adults are known for parental care, where females coil around the eggs in the vicinity of water (moisture) and free-living larvae are semi-aquatic.

**Ecological Significance:** Amphibians partly breathe through their skin due to which they are extremely sensitive to environmental changes. This makes them a reliable environmental indicator of pollution, climate change, environmental toxicity, etc. (Olson and Saenz, 2013) and can give ecologists insight into how an ecosystem is functioning. Besides, they are also instrumental in keeping the insect population in check through predation (Bowatte *et al.*, 2013; Khatiwada *et al.*, 2016). As a prey, amphibians also support the higher trophic levels of an ecosystem (Poulin *et al.*, 2001).

**Human Significance (economic importance, human and veterinary importance):** As a reliable environmental indicator, amphibians can be used in biomonitoring of ecosystems (Zhou *et al.*, 2008; Simon *et al.*, 2011). As a natural insect controller, amphibians control population of insect vectors, thus protecting humans from many vector-borne diseases as well as ecosystem services like controlling crop pest populations (Bowatte *et al.*, 2013; Khatiwada *et al.*, 2016). Frogs being a food delicacy in many

parts of the country (Saikia and Sinha, 2022) and across the world, this faunal group has the potential to address the concern of food security through controlled *ex-situ* breeding and rearing. And lastly, they can be a potential source of pharmaceutical compounds that can be of help to medical science (Saikia and Sinha, 2022).

**Protected Species as per WPA (2022):** Prior to the amendment of WPA in 2022, a few dicroglossid frogs (*Euphlyctis hexadactylus*, *Hoplobatrachus crassus* and *Hoplobatrachus tigerinus*) were accorded some protection under the Schedule-IV category of WPA (1972). However, with the recent amendment, there are 37 species of amphibians currently protected under Schedule-I and Schedule-II of the WPA (2022).

<b>Schedule I</b>		
<b>Sl. No</b>	<b>Common Name</b>	<b>Scientific Name</b>
1	Crocodile Newt	<i>Tylototriton verrucosus</i>
2	Himalayan Salamander	<i>Tylototriton himalayanus</i>
3	Koyna Toad	<i>Xanthophryne koynayensis</i>
4	Purple Frogs	All <i>Nasikabatrachus</i> species (2 species)
<b>Schedule II</b>		
<b>Sl. No</b>	<b>Common Name</b>	<b>Scientific Name</b>

15	Indian Skittering Frog	<i>Euphlyctis cyanophlyctis</i>
16	Indoburman Cascade Frog	<i>Amolops indoburmanensis</i>
17	Jerdon's White-lipped Horned Frog	<i>Megophrys major</i>
18	Kalasgram Skittering Frog	<i>Euphlyctis kalasgramensis</i>
19	Karaavali Pond Frog	<i>Phrynoderma karaavali</i>
20	Khare's Gliding Frog	<i>Pterorana kharei</i>
21	Kerala Pond Frog	<i>Phrynoderma kerala</i>
22	Liebig's Frog / Sikkim Paa Frog	<i>Nanorana liebigii</i>
23	Litoral Bullfrog	<i>Hoplobatrachus litoralis</i>
24	Mawphlang Hill Stream Frog	<i>Odorrana mawphlangensis</i>
25	Mokokchung Frog	<i>Nanorana mokokchungensis</i>
26	Orissa Frog	<i>Fejervarya orissaensis</i>
27	Perching Frog/ Six-Lined Tree Frog/ Terai tree frog	<i>Polypedates teraiensis</i>
28	Senchal Cascade Frog	<i>Amolops senchalensis</i>
29	Sikkim Ombrana	<i>Ombrana sikkimensis</i>
30	Terai Wart Frog	<i>Minervarya teraiensis</i>
31	Twin-spotted Tree Frog	<i>Rhacophorus bipunctatus</i>
32	Yellow-spotted White-lipped Horned Frog	<i>Megophrys flavipunctata</i>

## Species under CITES:

Earlier, under the CITES Appendix-II, only *Euphlyctis hexadactylus* and *Hoplobatrachus tigerinus* were included. However, additional two species of salamanders are recently included, which is summarized below:

- 1) *Euphlyctis hexadactylus* (Lesson, 1834)
- 2) *Hoplobatrachus tigerinus* (Daudin, 1802)
- 3) *Tylototriton verrucosus* Anderson, 1871
- 4) *Tylototriton himalayanus* Khatiwada, Wang, Ghimire, Vasudevan, Paudel and Jiang, 2015

**Invasive alien species:** Indian bullfrog (*Hoplobatrachus tigerinus*) is an invasive species in the Andaman archipelago, and is spreading rapidly in the islands group, and could extend its range into the Nicobar Islands, as well. The tadpoles of this species are reported to devour the tadpoles of native species (Mohanty and Measey, 2019).

**Gap areas:** Due to the cryptic nature of many frog species complexes, it is pertinent that molecular sequence data of all the amphibians known from India must be generated to understand their phylogenetic relationships. Besides many species of amphibians are only known from their respective type localities and even more than multi-decades since their description, little is known about their status. Additionally, our knowledge on the natural history, especially the breeding biology is almost non-existent baring a handful of species. Amphibian diversity from the Northeast India is poorly documented despite many new species reported in the last two decades.

**Background of Amphibian Checklist for India:** Systematic documentation of amphibians of India was initiated with the studies of Dutta (1997), and Das & Dutta (1998) in the end of the 20<sup>th</sup> century. Following this, amphibian checklists were compiled by Daniels (2001), Chanda (2002), Daniels (2005) and Dinesh *et al.* (2009a, 2009b, 2010, 2011, 2012, 2013, 2015, 2017, 2019, 2020 and 2021) at a regular pace.

Recent years have witnessed agglomeration of molecular studies into classical taxonomy more in terms of phylogenetics. Accordingly, Frost *et al.* (2006) changed the entire classification scheme and higher-level taxonomical treatments into a much simpler way. With the integration of classical taxonomy and phylogenetic studies many of the molecular level classifications were adopted in agreement with the ICZN code. Couple of years back, Dubois *et al.* (2021) proposed a new system of classification relying on phylogenetic studies with a few attempts of integrative taxonomic approach, though this scheme of classification was not completely followed by many of the global amphibian researchers including Amphibian Species of the World (ASW) global database (Frost, 2023).

Four species, *Phrynoderm a aloysii* Joshy, Alam, Kurabayashi, Sumida, and Kuramoto, 2009; *Phrynoderm a hexadactylum* (Lesson, 1834); *Phrynoderm a karaavali* Priti, Naik, Seshadri, Singal, Vidisha, Ravikanth, and Gururaja, 2016 and *Phrynoderm a kerala* Dinesh, Channakeshavamurthy, Deepak, Ghosh, and Deuti, 2021 are treated under the genus *Phrynoderm a* based on the studies of Dinesh *et al.*, 2020.

In the present checklist, *Bufoates pseudoraddei* (Mertens, 1971), *Minervarya greenii* (Boulenger, 1905), *Scutiger nyingchiensis* Fei, 1977, *Pseudophilautus nasutus* (Günther, 1869) and *Theloderma albopunctatum* (Liu and Hu, 1962) listed for India by Frost (2023) are not considered for India as they need confirmed records. The following species not reflected in the Frost (2023), *Allopaa barmoachensis* (Khan and Tasnim, 1989), *Allopaa hazarensis* (Dubois and Khan, 1979), *Fejervarya limnocharis* (Gravenhorst, 1829) and *Hylarana erythraea* (Schlegel, 1837) are included in the present list of India.

In view of these, we are taking here a pluralistic method of adopting a few of the proposals made by Dubois *et al.* (2021) and Portik *et al.* (2023) but largely following Frost (2023). Species list presented here is updated till September, 2023.
