**Introduction:** Termites are one of the oldest living organisms (Krishna *et al.*, 2013). In the tropics and subtropics, they constitute 10% of the total biomass and 95% of soil insect biomass (Jones and Eggleston, 2000). Being eusocial, caste system (the imago, soldiers and workers) is distinct, with well-marked division of labour. Imagoes or the alates perform reproduction and new colony formation, while the workers carry out the major tasks of maintaining the colony, including foraging, nursing and feeding, the soldiers defend the colony. Though high in population density, their species diversity is relatively less, compared to the other major insect orders.

**Global diversity:** More than 2942 described living species in 283 genera and 9 families distributed globally (Krishna *et al.*, 2013; Rajmohana *et al.*, 2019; Amina *et al.*, 2022).

**Diversity in India:** In India, 314 species belonging to 53 genera and 6 families are recorded.

**Endemism:** A total of 196 species are endemic to India. High endemism is reported from the state of Kerala and also from Andaman and Nicobar Islands.

**Habitat:** Abundant mostly in soil with decaying organic matter. The damp wood termites inhabit decaying wood in evergreen forests, while drywood termites live inside the structural wood/furniture.

**Ecological Significance:** In the tropics and subtropics, termites are significant as ecological engineers. They play a major role in enhancing soil nutrition, by decomposition of organic materials. They contribute to the carbon and nitrogen cycles and also aids in soil structuring.

**Human Significance:** They are economically important, as pests damaging structural wood and also live plants and trees in agriculture and forestry.

**Threatened species:** Species from India are not assessed for IUCN threat categories.

**Protected Species as per WPA (2022):** Termites are not listed under any schedules of Wildlife Protection Act (2022).

**Species under CITES:** Termites are not listed under any appendices of CITES.

**Invasive alien species:** Two species of termites *Cryptotermes dudleyi* Banks, 1918 and *Coptotermes gestroi* Wasmann, 1896 are reported to be invasive in India (Kalleshwaraswamy, 2022).

**Gap areas:** Since climate change can impact upon the potential distribution of pestiferous termite species, in depth studies on the distribution of termites in India is essential. Traditional identification methods, coupled with molecular techniques are needed to resolve some of the issues in termite taxonomy.

**Systematic list:** Species list attached.
