INTRODUCTION

Mutillidae is a family of Hymenoptera belongs to Superfamily Vespoidea. The members of this family are commonly called as “Velvet ants” because of their hairy appearance. The sting of these species is extremely painful and their exact chemical composition is still unknown. Sexual dimorphism is very much pronounced, majority of females is wingless but some are seen winged and the case of males is the exact opposite.

They are about 4,603 species in 220 genera worldwide (Pagliano *et al.*, 2020). They are found in nearly all parts of the temperate and tropical regions of the earth, but are more diverse in the tropics. 218 species of Mutillidae are known from India which belongs to 7 subfamilies viz. Myrmosinae, Pseudophotopsidinae, Ticoplinae, Myrmillinae, Mutillinae, Rhopalomutillinae, and Dasylabrinae (Lelej *et al.*, 2017; Girish Kumar *et al.*, 2019; Lelej, 2020; Lelej *et al.*, 2020; Pagliano *et al.*, 2020).

Mutillidae have host relationship with mature larvae or pupae of other solitary Hymenoptera. Also, they have been observed targeting non-feeding stages of Diptera, Coleoptera, Lepidoptera, Blattodea, and even some eusocial Hymenoptera (Brothers *et al.*, 2000).

The study on family Mutillidae in India dates back to 1775 when Fabricius in his “Systema Entomologiae” described *Sphex villosa* from South India which was later transferred to the genus *Trogaspidia* Ashmead. Some of the earliest major works was done by Bingham (1897) and Hammer (1962). Lelej (2005) described some new species from India. Nithya and Dey (2013 a, b), Das and Girish Kumar (2016 a, b) and Das *et al.* (2017) also studied the Mutillidae of India. Girish Kumar *et al.* (2019) reported the genus *Kudakrumia* Krombein for the first time in India with two species: *K. mirabilis* Krombein, 1979 and *K. rangnekari* Girish Kumar and Lelej, 2019. Recently Lelej *et al.* (2020) reviewed the genus *Odontomutilla* Ashmead from the Indian subcontinent with one new species from India and another from Sri Lanka.
